

Radiance modeling of translucent glazings, a practical approach

- What we get from radiance modeling
- Why translucent glazings? – a solution to daylighting
- How I measure and model diffusing materials
- My deliverables: quick turnaround reasonable quality renderings.
- Cool time lapse rendering comparisons

Radiance Modelling

We use Radiance as both:

- **Selling Tool** — for both ourselves and for building design professionals, who have to justify the decision to use Solera in their project.
- **Design Tool** — With Radiance we can determine the appropriate light transmittance to use, and what changes will be had from different configurations.

Design example:

Why Translucents?

- A different way to introduce natural light

Daylighting: renewed importance

- With current energy concerns daylighting is receiving renewed attention
- LEED program and the daylighting requirements it puts forward are forcing building design professionals to incorporate natural lighting in their projects.

Problem with LEED

- LEED is creating awareness and activity with respect to daylighting, but...
- LEED requirements only stipulate a quantity of daylight. And to meet the requirement a space need not be functional and well lit.

- ‘Traditional’ Daylighting Approaches: both good and bad
 - East-west orientation
 - Northern glass is ok
 - Use overhangs on south
 - Skylights with deep light-colored wells
 - Minimal glazing on east and west
 - Reflectives, dark tints, shades, frit simply block light

Where are all the daylight buildings?

- Victims of project realities
 - Budget
 - Site Considerations
 - Style

Typical Occupant Solution

“NO BLINDS!!!!”

The reality of ignoring daylight

- NRC Canada studies:
 - 65% of window area studied ‘permanently occluded by blinds’
 - Blinds cited as largest reason for failure of projected energy savings

Simple and Cost-Effective Daylighting through Translucence

- **Controlled** daylight
- **Consistent** direction / distribution
- **Reduced** glare
- **Improved** penetration

45°
Incident
Light

Solera™ L
sample

Detector
this is moved
through angles from
+90 to -90

Acid Etched - 45° incidence

Solera™ L - 45° Incidence

First step: get drawings of the space (typically CAD).

Next we Create a 3D model in Autocad
