Glare source(s)

OUTPUT

Glare metrics

DGP = 0.27
DGI = 17.46
UGR = 21.1
VCP = 49.6
CGI = 25.17
etc.

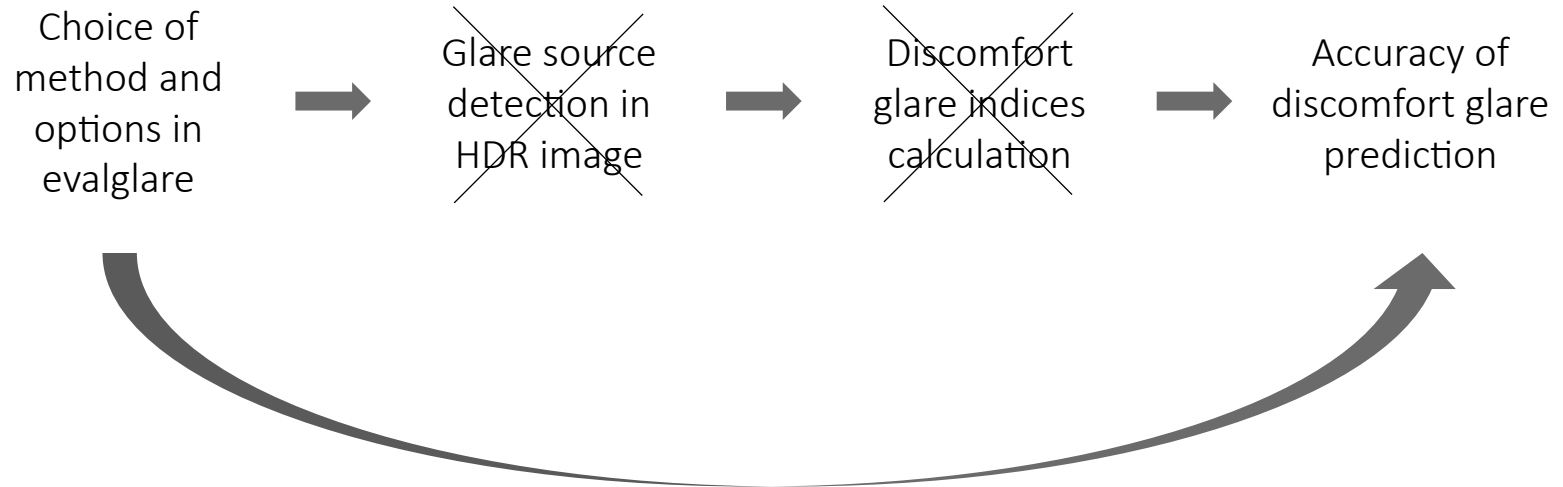

Glare source detection algorithm based on:

- factor method ($L_{ts} > K * L_{ave}$)
- a chosen method threshold method ($L_{ts} > T$)
- task area method ($L_{ts} > K * L_{task}$)
- background luminance definition
- chosen options
 - search radius
 - task area size
 - smoothing

➔ Which and how to choose?

Aim of the study

Investigate the effect of **evalglare methods/options** on the accuracy of **discomfort glare prediction**

Accuracy of discomfort glare prediction: discomfort glare index ~ subjective glare rating

Methodology

Choice of method and options in evalglare Accuracy of discomfort glare prediction

Total = 63	Factor 5	Factor 6	Factor 7	Factor 8	Threshold 1000	Threshold 2000	Threshold 4000	Task area 3	Task area 4	Task area 5	Task area 6
default											
$r = 0.06$											
$r = 0.3$											
math. Lb											
smoothed											
$ta = 30^\circ$											
$ta = 90^\circ$											

Methodology

Choice of method and options in evalglare  Accuracy of discomfort glare prediction

discomfort glare index \sim subjective glare rating

Daylight Glare Probability (DGP)

Discomfort Glare Index (DGI)

CIE Glare Index (CGI)

modified Discomfort Glare Index (DGI_{mod})

Unified Glare Probability (UGP)

\sim 4-point glare scale (or binary transformation)

3 indicators

Spearman correlation
coefficient
(ρ)

min ρ : worse accuracy
max ρ : best accuracy

Area Under the ROC Curve
of a binary logistic regression
(AUC)

min AUC : worse accuracy
max AUC : best accuracy

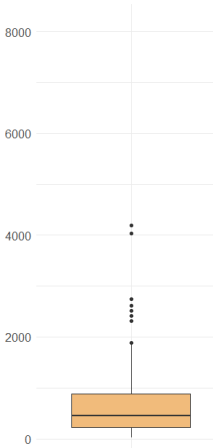

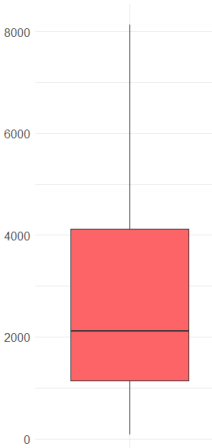

Corrected Akaike's Information
Criterion of an ordinal logistic
regression (AICc)

max AICc : worse accuracy
min AICc : best accuracy

/!\ Bonferroni correction: $p\text{-value} < 0.05/63 = p\text{-value} < 0.00079$

Data

2 different datasets:

	FIELD EXPERIMENT	LABORATORY EXPERIMENT
<i>Location</i>	Louvain-la-Neuve, Belgium	Freiburg, Germany
<i>Period</i>	2017	2008-2011
<i>Subjects</i>	82	41
<i>Men/Women (%)</i>	43/57	73/27
<i>Mean Age (SD)</i>	36 (11)	26 (3)
<i>Glare evaluations</i>	141	180
<i>4-Point Glare Scale</i>	No discomfort A small discomfort A moderate discomfort A large discomfort	Imperceptible Noticeable Disturbing Intolerable
<i>Vertical illuminance at eye level (lux)</i>		

Results: evalglare methods

FIELD EXPERIMENT

ρ

AUC

AICc

LABORATORY EXPERIMENT

Results: evalglare methods

Problematic factor method:

- ➔ over-detection for dim light scenes
- ➔ under-detection for bright light scenes

e.g. dim light scene (factor 5)
rated as «No discomfort»

e.g. bright light scene (factor 7)
rated as «Disturbing»

Results: background luminance definition

FIELD EXPERIMENT

ρ

AUC

AICc

LABORATORY EXPERIMENT

Results: distance of search radius

FIELD EXPERIMENT

LABORATORY EXPERIMENT

ρ

AUC

AICc

Results: task area size

FIELD EXPERIMENT

LABORATORY EXPERIMENT

ρ

AUC

AICc

Results: task area size

Variation of task luminance according to task area size

➔ in field study, small task area size leads to a slightly more constant task luminance

Results: smooth option

FIELD EXPERIMENT

LABORATORY EXPERIMENT

Results: smooth option

Effect of smooth option on Glare Impact?

$$GI = \sum_i L_{s,i}^2 * \omega_i / L_b * P_i^2$$

- ➔ bright scenes: squared decrease in $L_{s,i}$ generally balanced by increase in ω_i
 - ➔ dim scenes: squared decrease in $L_{s,i}$ not entirely balanced by increase in ω_i
 - ➔ only constant variation due to smooth option is decrease in L_b
- } no constant effect of smooth option

CONCLUSION

Recommandations for evalglare:

- method:
 - scenes with contrast glare → task area (x 4/5) method
 - scenes with saturation glare → threshold (2000 cd/m²) or task area (x 4/5) method
- background luminance definition: no influence
- search radius: $r = 0.2$ rad. (default in evalglare)
- task area size: $ta = 30^\circ \rightarrow 60^\circ$
- smooth option: generate a more accurate discomfort glare prediction → L_b ?
/!\ no unreasonable use of smooth option to improve discomfort glare studies results,
but reconsideration of the Glare Impact formula

CONCLUSION

Choice of appropriate evalglare method and options is important!

b1000_Lb

t3_smoothed

b1000_r0.06

b7_Lb

CONCLUSION

Changes in evalglare (for version 2.06):

- New default method: threshold (2000 cd/m²)
/!\ if task method is chosen (-t or -T), factor x=5 is default
- New default background luminance calculation: CIE-method ($L_b = (E_v - E_{dir})/\pi$)
- New option *-q method*: choose background luminance calculation
method = 0: CIE, $L_b = (E_v - E_{dir})/\pi$
method = 1: mathematical average background luminance
method = 2: $L_b = E_v/\pi$ (NOT RECOMMENDED)

Thank you!
