

Using Radiance as a baseline for interactive glare risk assessment on the GPU

Radiance Workshop 2023

Ömercan Yazici, Saarland University

VELUX STIFTUNG

Outline

Motivation

Interactive rendering

- Allow user to change view & lighting conditions
- Explore scene and detect glare risks

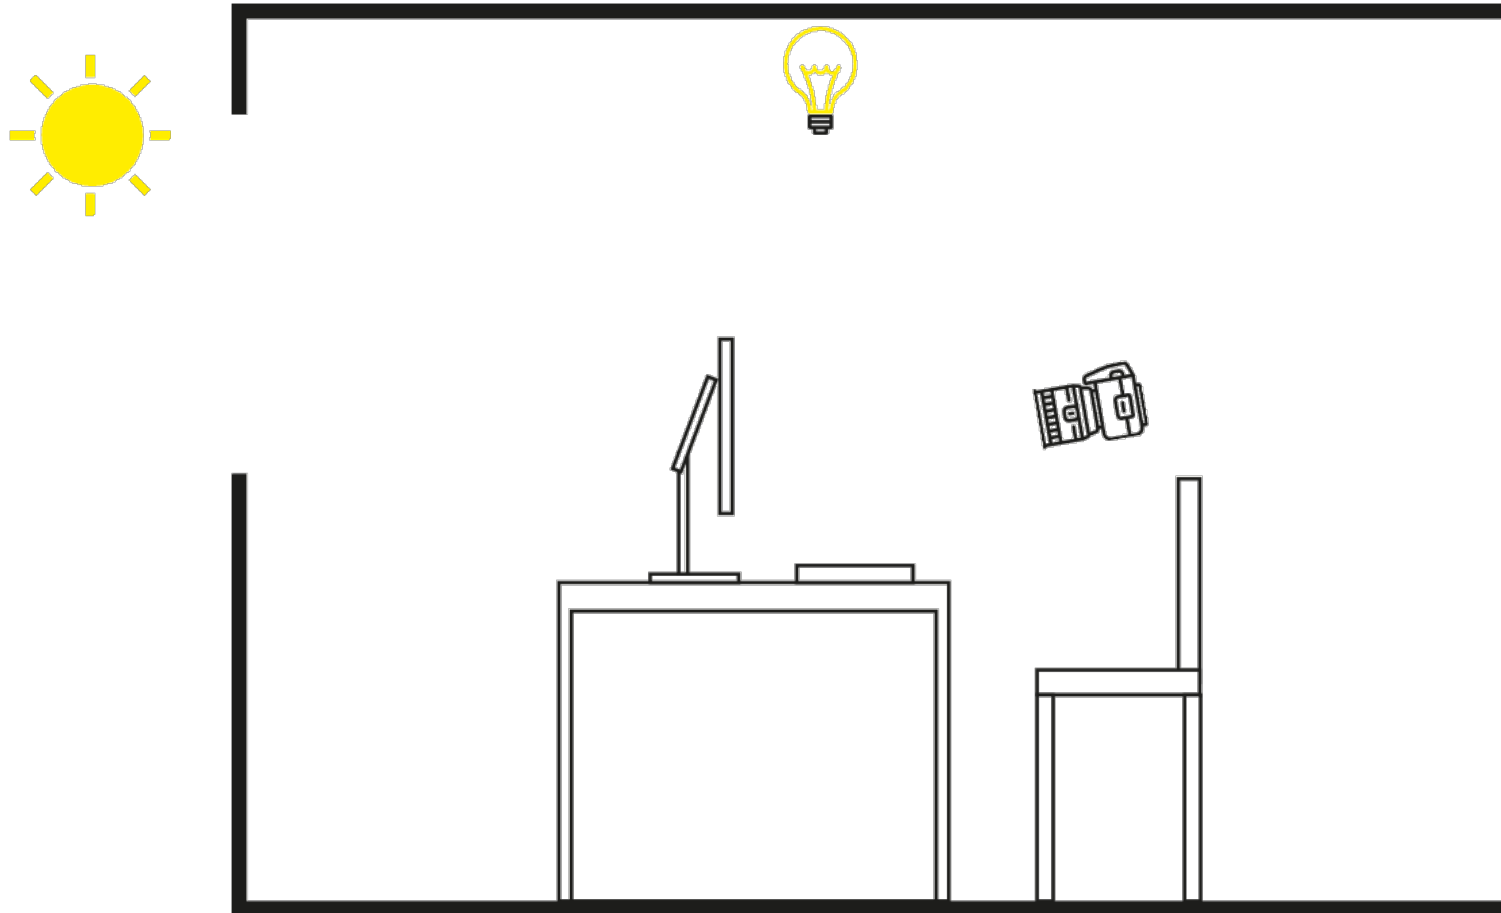

Why compare to Radiance?

- Radiance is well evaluated
- De-facto standard in glare evaluation

Ignis

Our own GPU renderer

Monte-Carlo Raytracing

Ignis

- JIT compiling
- CPU & GPU support
- Realtime & Offline capability
- Used in education

igview

- Frontend for Ignis
- Allows interaction with the scene
- Live denoising
- Live 'evalglare'

igcli, igtrace & Python

- igcli is a simple console client like rpict
 - This is the frontend we evaluate with
- igtrace allows traversing user defined rays in the same way as rtrace
- We do have full Python integration with Jupyter Notebooks and more!

Challenges

When is enough?

- Ignis uses samples per pixel (SPP) as user parameter
 - Monte-Carlo: Square SPP decreases error by half
- Quality = SPP?
 - Not straightforward
- One solution:
 1. Render with Radiance
 2. Render with Ignis the same duration
- Use time instead of SPP

Parameter Jungling

```
-u+ -ar 0 -aa 0 -as 0 -av 0 0 0 -aw 0 -st 0 -dt 0 -dp 0 -dc 0 -lr 0  
-ad 800 -lw 0.00125 -ss 0 -ab 16
```

- Pure Monte-Carlo
- No ambient interpolation
- Sample all highlights
- Follow all shadow rays
- Russian Roulette
- High Ambient division
- Sharp reflections
- Indirect Bounces

Evaluation

Unit Tests

- Generate references using Radiance
- Try to render the same image with our renderer
- Only test specific components
 - Light types
 - Materials
 - Shapes
 - Patterns
 - ...
- **Advantage:** Easy to find local mistakes
- **Disadvantage:** Does not test interaction of components
- **Disadvantage:** Impossible to test every input parameter

BRTDfunc

Ignis

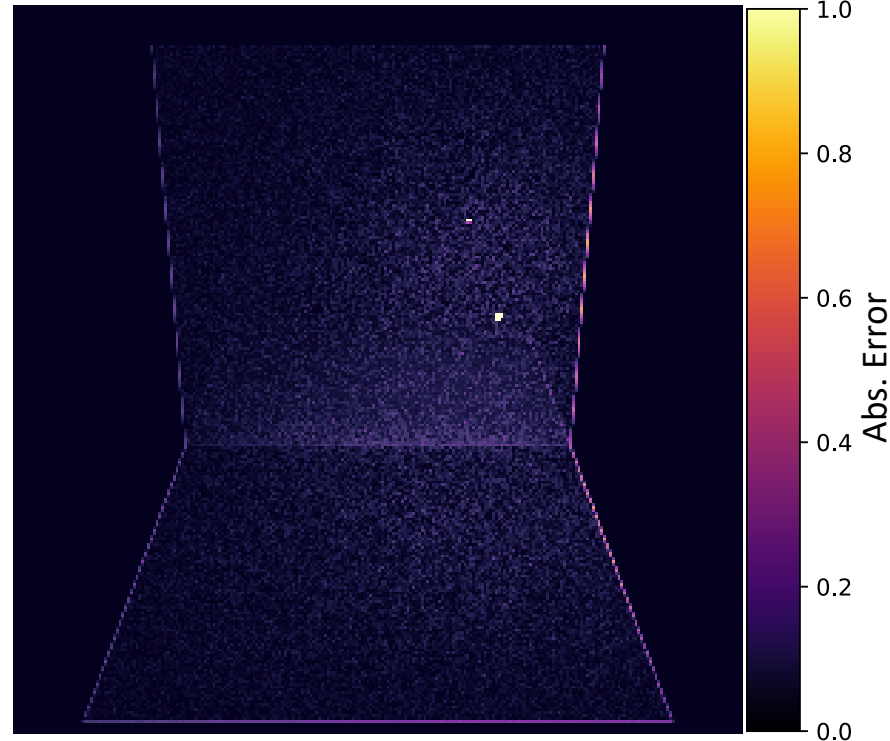

Radiance

BRTDfunc

Radiance

Perez Sky Model

Ignis

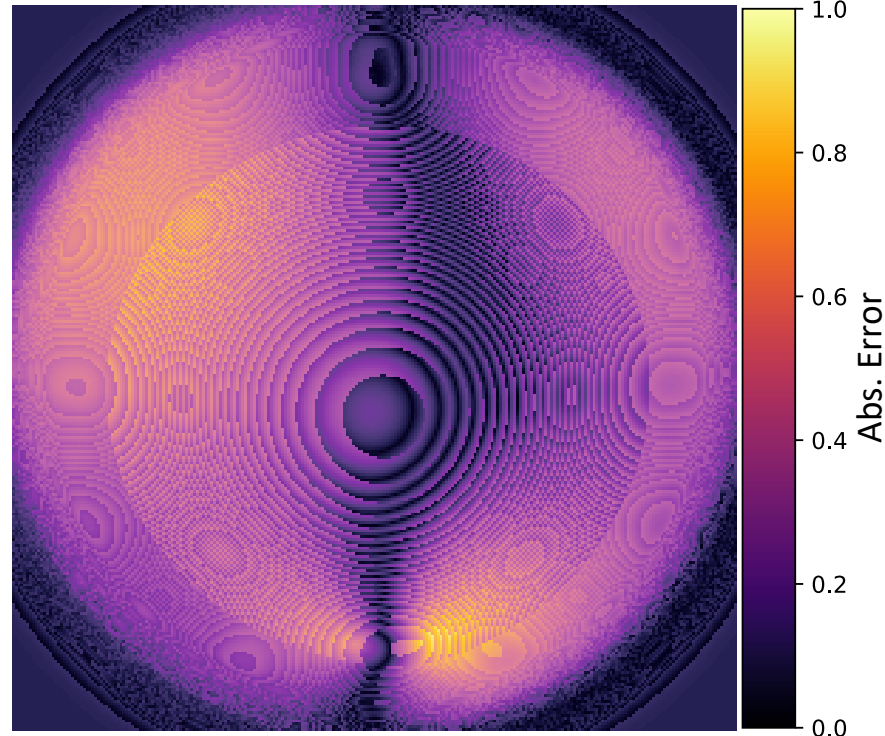

Radiance

Perez Sky Model

Ignis

Radiance

Image & Physical Metrics

- Quality metric: Mean Squared Error
- Requires high-quality reference image
- No comparison per-pixel
 - Too big difference in pixel filter handling

DGP Evaluation

Office

Evaluated on a Laptop with Intel i9-10885H CPU and NVIDIA Quadro T2000 GPU with Max-Q Design

DGP Evaluation

Laboratory

Evaluated on a Laptop with Intel i9-10885H CPU and NVIDIA Quadro T2000 GPU with Max-Q Design

Outlook

Peak Extraction

- Our handling of peaks is just brute-force
- Make it smarter!
- Peak extraction using better BSDF representations?
- Path Guiding?

Performance

- We want Realtime!
- Make use of hardware accelerated raytracing

Thanks for listening!
